

Assignment - Sinatra

In this assignment, use Sinatra web development framework, to implement a simple bet web application.

Your web application will create these different views:

Gambling Site

User

Password

Login

Gambling Site

place your bet on dice number (1 to 6)

bet money

on

bet

total win

total loss

total profit

account

total win	total loss	total profit
<input type="text"/>	<input type="text"/>	<input type="text"/>

Logout

When user come to the gambling site, user is presented with a login in view.
The login/password information are in a database table as plain text. (you need to initialize this table in advance)

if user is logged in, user is presented with a view for betting (just like the example in class except user use a form to submit bet information)

you will display text showing if user has won or lost.

also in this view, you will also need to show two set of data,

one set is on the left, these are total values during this logon session
these values are 0 after login, and will be saved in session hash,
but after logout, you need to add these to the database table,

The value in database table are total values for this user since first time login.

so each time the user login, you will retrieve these values from database table and display them at the bottom.

and each time user logout, you need to add session value into these value and restore in the database table.

the logout button will clear the session and return to login page.
